Part I

General information

1 Calculation of sample moments

We use extension of Welford's method from Knuth. For every n-th element x we have

$$\delta = x - m_1,$$

$$m'_1 = m_1 + \frac{\delta}{n},$$

$$m'_2 = m_2 + \delta^2 \frac{n-1}{n},$$

$$m'_3 = m_3 + \delta^3 \frac{(n-1)(n-2)}{n^2} - 3\delta \frac{m_2}{n},$$

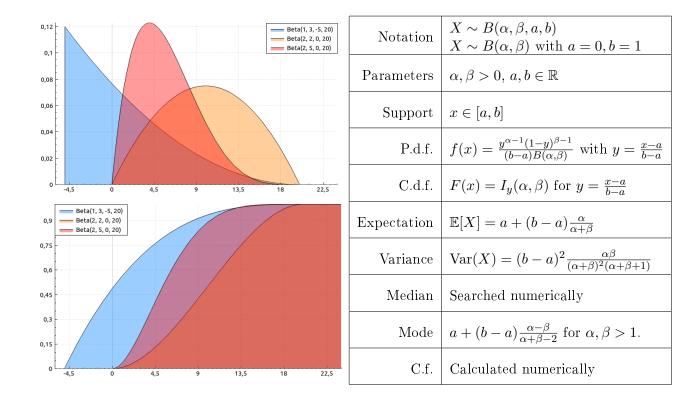

$$m'_4 = m_4 + \delta^4 \frac{(n-1)(n^2 - 3n + 3)}{n^3} + 6\delta^2 \frac{m_2}{n^2} - 4\delta \frac{m_3}{n}.$$

Then $\mathbb{E}[X] = m_1'$, $\operatorname{Var}(X) = \frac{m_2}{n}$, $\operatorname{Skew}(X) = \frac{\sqrt{n}m_3'}{m_2'^{3/2}}$ and $\operatorname{Kurt}(X) = \frac{nm_4'}{m_2'^2}$ (we return excess kurtosis).

Part II

Continuous univariate distributions

2 Beta distribution

Estimation of shapes with known support. Assume that a = 0, b = 1 and we have a sample $X = (X_1, \ldots, X_n)$. Then a log-likelihood function is

$$\ln \mathcal{L}(\alpha, \beta | X) = \sum_{i=1}^{n} \ln f(X_i; \alpha, \beta)$$

$$= (\alpha - 1) \sum_{i=1}^{n} \ln X_i + (\beta - 1) \sum_{i=1}^{n} \ln(1 - X_i) - n \ln B(\alpha, \beta).$$
(1)

Differentiating with respect to the shapes, we obtain

$$\frac{\partial \ln \mathcal{L}(\alpha, \beta | X)}{\partial \alpha} = \sum_{i=1}^{n} \ln X_i + n(\psi(\alpha + \beta) - \psi(\alpha)),$$

$$\frac{\partial \ln \mathcal{L}(\alpha, \beta | X)}{\partial \beta} = \sum_{i=1}^{n} \ln(1 - X_i) + n(\psi(\alpha + \beta) - \psi(\beta)).$$

Differentiating again we get the Hessian matrix:

$$H(\ln \mathcal{L}(\alpha, \beta | X)) = n \cdot \begin{pmatrix} \psi_1(\alpha + \beta) - \psi_1(\alpha) & \psi_1(\alpha + \beta) \\ \psi_1(\alpha + \beta) & \psi_1(\alpha + \beta) - \psi_1(\beta) \end{pmatrix}.$$

Then we can find the estimators numerically, using Newton's procedure. The initial values of estimators are found via method of moments:

$$\hat{\alpha}_0 = \overline{X}_n \left(\frac{\overline{X}_n (1 - \overline{X}_n)}{\hat{s}_n^2} - 1 \right),$$

$$\hat{\beta}_0 = (1 - \overline{X}_n) \left(\frac{\overline{X}_n (1 - \overline{X}_n)}{\hat{s}_n^2} - 1 \right).$$

These values are applicable only if $\hat{s}_n^2 < \overline{X}_n(1 - \overline{X}_n)$. If this condition is not satisfied, we set $\hat{\alpha}_0 = \hat{\beta}_0 = 0.001$.

In the general case, when $a \neq 0$ or $b \neq 1$, we use the following transformation:

$$Y_i = \frac{X_i - a}{b - a}$$

and estimate parameters, using sample Y.

2.1 Arcsine distribution

Relation to Beta distribution:

$$X \sim B(1 - \alpha, \alpha, a, b).$$

Estimation of shape. For Arcsine distribution log-likelihood function (1) turns into

$$\ln \mathcal{L}(\alpha|X) = -\alpha \sum_{i=1}^{n} \ln X_i + (\alpha - 1) \sum_{i=1}^{n} \ln(1 - X_i) - n \ln B(1 - \alpha, \alpha).$$

Taking the derivative with respect to α we get

$$\frac{\partial \ln \mathcal{L}(\alpha|X)}{\partial \alpha} = \sum_{i=1}^{n} \ln \frac{1 - X_i}{X_i} + n\pi \cot(\pi \alpha).$$

Therefore, maximum-likelihood function is

$$\hat{\alpha} = -\frac{1}{\pi} \operatorname{atan} \left(\frac{n\pi}{\sum_{i=1}^{n} \ln \frac{1 - X_i}{X_i}} \right).$$

If $\hat{\alpha}$ is negative, we add 1, because $\frac{\text{atan}}{\pi} \in (-0.5, 0.5)$, while $\alpha \in (0, 1)$.

2.2 Balding-Nichols distribution

Notation:

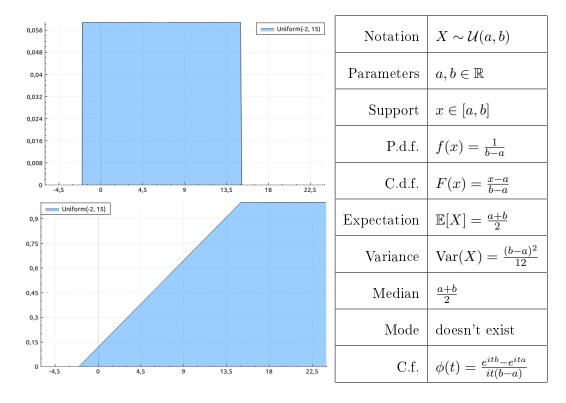

$$X \sim \text{Balding} - \text{Nichols}(p, F)$$

with $p, F \in (0, 1)$. Relation to Beta distribution:

$$X \sim B(pF', (1-p)F')$$

with
$$F' = (1 - F)/F$$
.

2.3 Uniform distribution

Relation to Beta distribution:

$$X \sim B(1, 1, a, b).$$

Estimation of support.

Frequentist inference. Likelihood function is

$$\mathcal{L}(a,b|X) = \frac{1}{(b-a)^n} \mathbf{1}_{\{X_i \in [a,b] \ \forall i=1,...,n\}}.$$

Therefore, $\mathcal{L}(a,b|X)$ is the largest for $\hat{b}=X_{(n)}$ and $\hat{a}=X_{(1)}$. However, using the fact that $X_{(k)}\sim B(k,n+1-k,a,b)$, these are biased estimators:

$$\mathbb{E}[X_{(1)}] = \frac{an+b}{n+1} \quad \text{and} \quad \mathbb{E}[X_{(n)}] = \frac{a+bn}{n+1}.$$

To get unbiased estimators we make the transformations:

$$\tilde{a} = \frac{nX_{(1)} - X_{(n)}}{n-1}$$
 and $\tilde{b} = \frac{nX_{(n)} - X_{(1)}}{n-1}$.

Then we get

$$\mathbb{E}[\tilde{a}] = \frac{n\mathbb{E}[X_{(1)}] - \mathbb{E}[X_{(n)}]}{n-1} = \frac{n(an+b) - (a+bn)}{n^2 - 1} = a.$$

Analogously, $\mathbb{E}[\tilde{b}] = b$.

Bayesian inference. Let us say, we try to estimate $\theta = b - a$ with known a. We set the prior distribution $\theta \sim \text{Pareto}(\alpha, \sigma)$:

$$h(\theta|\alpha,\sigma) = \frac{\alpha\sigma^{\alpha}}{\theta^{\alpha+1}} \mathbf{1}_{\{\theta \ge \sigma\}}.$$

The density of posterior distribution is

$$f(\theta|X) \propto \frac{\alpha \sigma^{\alpha}}{\theta^{\alpha+n+1}} \mathbf{1}_{\{\theta \geq \max(\sigma, X_{(n)} - a)\}} \sim \operatorname{Pareto}(\alpha + n, \max(\sigma, X_{(n)} - a)).$$

Hence, Bayesian estimator is

$$\mathbb{E}[\theta|X] = \frac{\alpha+n}{\alpha+n-1} \max(\sigma, X_{(n)} - a)$$

and MAP estimator is

$$\theta_{MAP} = \max(\sigma, X_{(n)} - a).$$

3 Beta-prime distribution

Relation to other distributions:

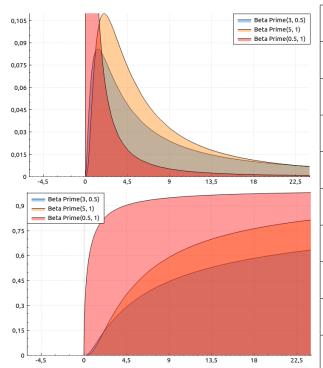

$$\frac{X}{1+X} \sim B(\alpha, \beta),$$

$$\frac{\beta}{\alpha}X \sim F(2\alpha, 2\beta).$$

Estimation of shapes. Using relationship with Beta distribution we transform the sample:

$$Y_i = \frac{X_i}{1 + X_i}, \quad 1 \le i \le N,$$

and run BetaRand estimation for Y.

Notation	$X \sim B'(\alpha, \beta)$
Parameters	$\alpha, \beta > 0$
Support	$x \in \mathbb{R}^+$
P.d.f.	$f(x) = \frac{x^{\alpha - 1}(1 + x)^{-\alpha - \beta}}{B(\alpha, \beta)}$
C.d.f.	$F(x) = I_{\frac{x}{1+x}}(\alpha, \beta)$
Expectation	$\mathbb{E}[X] = \frac{\alpha}{\beta - 1} 1_{\{\beta > 1\}} + \infty 1_{\{\beta \le 1\}}$
Variance	$\operatorname{Var}(X) = \frac{\alpha(\alpha+\beta-1)}{(\beta-2)(\beta-1)^2}, \text{ if } \beta > 1$
Median	Searched numerically
Mode	$\max\left(\frac{\alpha-1}{\beta+1},0\right)$.
C.f.	Calculated numerically

4 Degenerate distribution

Notation	$X \sim \delta(a)$
Parameters	$a \in \mathbb{R}$
Support	x = a
P.d.f.	$f(x) = \delta(a)$
C.d.f.	$F(x) = 1_{\{x \le a\}}$
Expectation	$\mathbb{E}[X] = a$
Variance	Var(X) = 0
Median	a
Mode	a
C.f.	$\phi(t) = e^{ita}$

5 Exponentially-modified Gaussian distribution

Notation	$X \sim \mathrm{EMG}(\mu, \sigma, \lambda)$
Parameters	$\mu \in \mathbb{R}, \sigma > 0, \lambda > 0$
Support	$x \in \mathbb{R}$
P.d.f.	$f(x) = \dots$
C.d.f.	$F(x) = \dots$
Expectation	$\mathbb{E}[X] = \mu + 1/\lambda$
Variance	$\operatorname{Var}(X) = \sigma^2 + 1/\lambda^2$
Median	Searched numerically
Mode	Searched numerically
C.f.	$\phi(t) = \dots$

6 F-distribution

Notation	$X \sim \mathrm{F}(d_1, d_2)$
Parameters	$d_1, d_2 > 0$
Support	$x \in \mathbb{R}^+$
P.d.f.	$f(x) = \frac{\sqrt{\frac{(d_1 x)^{d_1} d_2^{d_2}}{(d_1 x + d_2)^{d_1 + d_2}}}}{xB\left(\frac{d_1}{2}, \frac{d_2}{2}\right)}$
C.d.f.	$F(x) = I_{\frac{d_1 x}{d_1 x + d_2}} \left(\frac{d_1}{2}, \frac{d_2}{2} \right)$
Expectation	$\mathbb{E}[X] = \frac{d_2}{d_2 - 2} \text{ for } d_2 > 2$
Variance	$Var(X) = \frac{2d_2^2(d_1 + d_2 - 2)}{d_1(d_2 - 2)^2(d_2 - 4)} \text{ for } d_2 > 4$
Median	Searched numerically
Mode	$\max\left(\frac{d_2(d_1-2)}{d_1(d_1+2)}, 0\right)$
C.f.	Calculated numerically

Relation to other distributions:

$$\frac{d_1X}{d_2+d_1X} \sim B\left(\frac{d_1}{2}, \frac{d_2}{2}\right),$$
$$\frac{d_1}{d_2}X \sim B'\left(\frac{d_1}{2}, \frac{d_2}{2}\right).$$

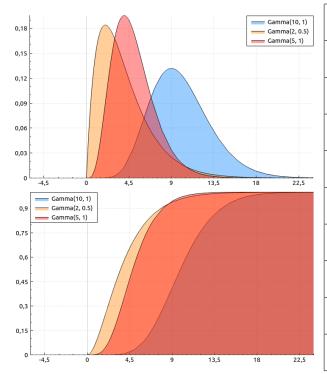

7 Gamma distribution

7.1 Chi-squared distribution

Relation to Gamma distribution:

7.2 Erlang distribution

The only difference between Gamma and Erlang distributions is that a second one takes an integer shape parameter k.

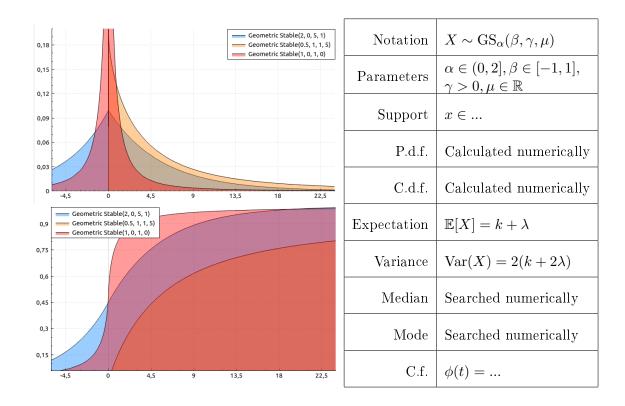

Notation	$X \sim \Gamma(\alpha, \beta)$
Parameters	$\alpha > 0, \beta > 0$
Support	$x \in \mathbb{R}^+$
P.d.f.	$f(x) = \frac{\beta^{\alpha}}{\Gamma(\alpha)} x^{\alpha - 1} e^{-\beta x}$
C.d.f.	$F(x) = P(\alpha, \beta x)$
Expectation	$\mathbb{E}[X] = \frac{\alpha}{\beta}$
Variance	$\operatorname{Var}(X) = \frac{\alpha}{\beta^2}$
Median	Searched numerically
Mode	$\max\left(\frac{\alpha-1}{\beta},0\right)$
C.f.	$\phi(t) = \left(1 - \frac{it}{\beta}\right)^{-\alpha}$

7.3 Exponential distribution

Notation	$X \sim \operatorname{Exp}(\lambda)$
Parameters	$\lambda > 0$
Support	$x \in \mathbb{R}^+$
P.d.f.	$f(x) = \lambda e^{-\lambda x}$
C.d.f.	$F(x) = 1 - e^{-\lambda x}$
Expectation	$\mathbb{E}[X] = \frac{1}{\lambda}$
Variance	$\operatorname{Var}(X) = \frac{1}{\lambda^2}$
Median	$\frac{\ln(2)}{\lambda}$
Mode	0
C.f.	$\phi(t) = \frac{\lambda}{\lambda - it}$

Relation to Gamma distribution: $X \sim \Gamma(1, \beta)$.

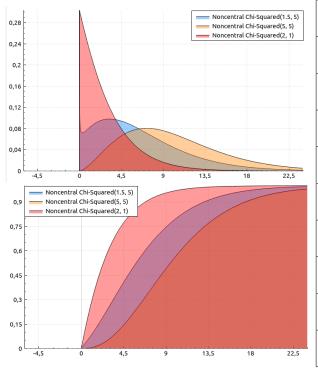

8 Geometric Stable distribution

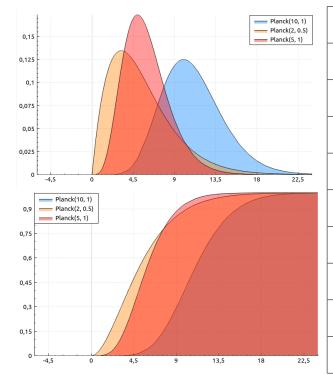

- 8.1 Asymmetric Laplace distribution
- 8.2 Laplace distribution
- 9 Noncentral Chi-Squared distribution
- 10 Planck distribution
- 11 Stable distribution
- 11.1 Normal distribution

Relation to Stable distribution:

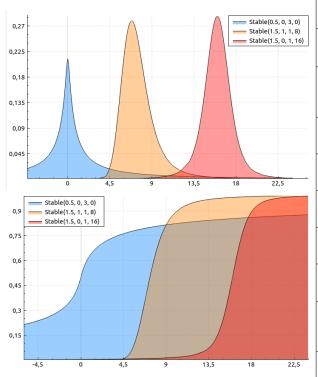

$$X \sim S_2(\cdot, \sigma^2/2, \mu)$$

Notation	$X \sim \chi_k^{\prime 2}(\lambda)$
Parameters	$k > 0, \lambda > 0$
Support	$x \in \mathbb{R}^+$
P.d.f.	$f(x) = \dots$
C.d.f.	$F(x) = P_{\frac{k}{2}}(\dots)$
Expectation	$\mathbb{E}[X] = k + \lambda$
Variance	$Var(X) = 2(k+2\lambda)$
Median	Searched numerically
Mode	Searched numerically
C.f.	$\phi(t) = \frac{\exp\frac{it\lambda}{1-2it}}{(1-2it)^{k/2}}$

Notation	$X \sim \operatorname{Planck}(a, b)$
Parameters	a, b > 0
Support	$x \in \mathbb{R}^+$
P.d.f.	$f(x) = \frac{b^{a+1}}{\Gamma(a+1)\zeta(a+1)} \cdot \frac{x^a}{e^{bx} - 1}$
C.d.f.	Calculated numerically
Expectation	$\mathbb{E}[X] = \frac{(a+1)\zeta(a+2)}{b\zeta(a+1)}$
Variance	$Var(X) = \frac{(a+1)(a+2)\zeta(a+3)}{b^2\zeta(a+1)} - (\mathbb{E}[X])^2$
Median	Searched numerically
Mode	$\frac{W_0(-ae^{-a})+a}{b}$, if $a>1$, otherwise 0
C.f.	Calculated numerically

Notation	$X \sim S_{\alpha}(\beta, \gamma, \mu)$
Parameters	$\alpha \in (0,2], \beta \in [-1,1],$ $\gamma > 0, \mu \in \mathbb{R}$ $x \in \mathbb{R}, \text{ if } \beta \neq 1,$
Support	$x \in \mathbb{R}$, if $\beta \neq 1$, $x \in [\mu, \infty)$, if $\beta = 1$, $\alpha < 2$, $x \in (-\infty, \mu]$, if $\beta = -1$, $\alpha < 2$
P.d.f.	Calculated numerically
C.d.f.	Calculated numerically
Expectation	$\mathbb{E}[X] = \mu \text{ for } \alpha > 1,$ otherwise undefined
Variance	$Var(X) = 2\gamma^2 1_{\{\alpha=2\}} + \infty 1_{\{\alpha<2\}}$
Median	μ for $\beta = 0$, otherwise searched numerically
Mode	μ , if $\beta = 0$ or $\alpha = 2$, $\mu + \frac{\beta \gamma}{3}$, if $ \beta = 1$ and $\alpha = \frac{1}{2}$, otherwise searched numerically
C.f.	$\phi(t) = \dots$

11.2 Cauchy distribution

Relation to Stable distribution:

$$X \sim S_1(0, \gamma, \mu)$$

11.3 Levy distribution

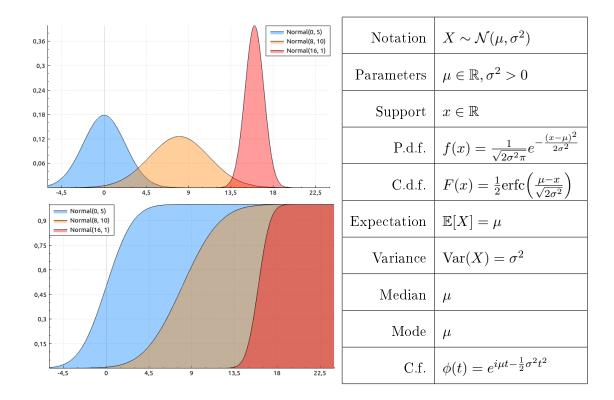

Relation to Stable distribution:

$$X \sim S_{\frac{1}{2}}(1, \gamma, \mu)$$

11.4 Holtsmark distribution

Relation to Stable distribution:

$$X \sim S_{\frac{3}{2}}(0, \gamma, \mu)$$

11.5 Landau distribution

Relation to Stable distribution:

$$X \sim S_1(1, \gamma, \mu)$$

12 Pareto distribution

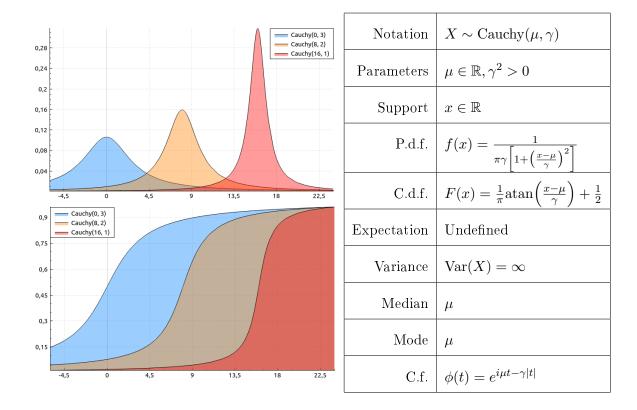

Estimation of parameters.

Frequentist inference. Log-likelihood function is

$$\ln \mathcal{L}(\alpha, \sigma | X) = n \ln \alpha + n\alpha \ln \sigma - (\alpha + 1) \sum_{i=1}^{n} \ln X_i.$$

We assume that $\sigma \leq X_{(1)}$, otherwise sample X couldn't have been generated from such distribution. It is obvious, that $\ln \mathcal{L}(\alpha, \sigma | X)$ is an increasing function in terms of σ , therefore $\hat{\sigma} = X_{(1)}$ is an optimal estimator. Let's take derivative with respect to α :

$$\frac{\partial \ln \mathcal{L}(\alpha, \sigma | X)}{\partial \alpha} = \frac{n}{\alpha} + n \ln \sigma - \sum_{i=1}^{n} \ln X_i.$$

From this we conclude that the maximum-likelihood estimator of shape is

$$\hat{\alpha} = \frac{1}{\frac{1}{n} \left(\sum_{i=1}^{n} \ln X_i \right) - \ln \hat{\sigma}}.$$

It is known that $\hat{\sigma} \sim \operatorname{Pareto}(n\alpha, \sigma)$ and $\hat{\alpha} \sim \operatorname{Inv-}\Gamma(n-1, n\alpha)$ and they are independent. Then

$$\mathbb{E}[\hat{\sigma}] = \frac{\sigma}{1 - \frac{1}{n\alpha}}$$

and

$$\mathbb{E}[\hat{\alpha}] = \frac{n\alpha}{n-2}.$$

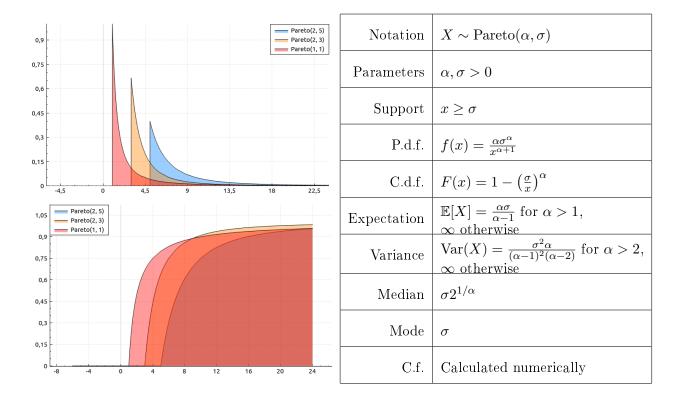

Therefore, in order to get unbiased estimators we need to make the following transformations:

$$\tilde{\alpha} = \frac{n-2}{n}\hat{\alpha}$$
 and $\tilde{\sigma} = \hat{\sigma} \left(1 - \frac{1}{(n-1)\hat{\alpha}}\right)$.

Note that if we estimate parameters separately, then $\hat{\alpha} \sim \text{Inv-}\Gamma(n, n\alpha)$ and transformations are different.

Bayesian inference. We now assume that σ is known and prior distribution of α is $\Gamma(\kappa, \beta)$:

$$h(\alpha) = \frac{\beta^{\kappa}}{\Gamma(\kappa)} \alpha^{\kappa - 1} e^{-\beta \alpha}.$$

The density of posterior distribution is

$$f(\alpha|X) \propto \prod_{i=1}^n \frac{\sigma^\alpha}{X_i^{\alpha-1}} \cdot \alpha^{\kappa+n-1} e^{-\beta\alpha} \propto \alpha^{\kappa+n-1} e^{-(\beta+\sum_{i=1}^n \ln(X_i/\sigma))\alpha}.$$

Therefore, $\alpha | X \sim \Gamma(\kappa + n, \beta + \sum_{i=1}^{n} \ln(X_i/\sigma))$ and Bayesian estimator is

$$\mathbb{E}[\alpha|X] = \frac{\kappa + n}{\beta + \sum_{i=1}^{n} \ln(X_i/\sigma)}.$$

MAP estimator is

$$\alpha_{MAP} = \frac{\kappa + n - 1}{\beta + \sum_{i=1}^{n} \ln(X_i/\sigma)}.$$

Note on fitting scale with Bayes: let it be vice versa, α is known while σ is not. Then we say that a priori $\sigma \sim \operatorname{Pareto}(\kappa, \theta)$:

$$h(\sigma) = \frac{\kappa \theta^{\kappa}}{\sigma^{\kappa+1}}.$$

Then posterior distribution is:

$$f(\sigma|X) \propto \prod_{i=1}^{n} \frac{1}{X_i^{\alpha-1}} \cdot \sigma^{\alpha n - \kappa - 1} \mathbf{1}_{\{\theta < \sigma < X_{(1)}\}} \sim \text{Bounded-Pareto}(\kappa - \alpha n, \theta, X_{(1)}).$$

This imposes the following additional constraints on the prior hyperparameters: $\kappa > \alpha n$ and $\theta < X_{(1)}$. Bayesian estimator:

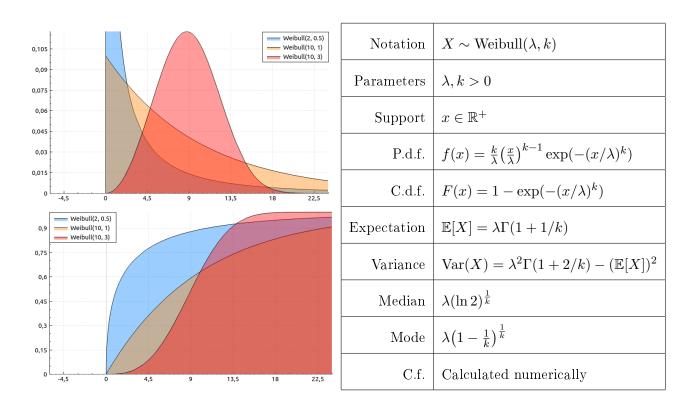

$$\mathbb{E}[\sigma|X] = \frac{\theta^{\alpha'}}{1 - \left(\frac{\theta}{X_{(1)}}\right)^{\alpha'}} \cdot \left(\frac{\alpha'}{\alpha' - 1}\right) \cdot \left(\frac{1}{\theta^{\alpha'}} - \frac{1}{X_{(1)}^{\alpha'}}\right)$$

with $\alpha' = \kappa - \alpha n$. MAP estimator is just

$$\sigma_{MAP} = \theta$$
.

However, Bounded-Pareto distribution is not yet supported.

13 Weibull

Estimation of scale

Frequentist inference. Log-likelihood function:

$$\ln \mathcal{L}(\lambda, k|X) = n(\ln k - \ln \lambda) + (k-1)\sum_{i=1}^{n} (\ln X_i - \ln \lambda) - \frac{1}{\lambda^k}\sum_{i=1}^{n} X_i^k.$$

The derivative with respect to scale:

$$\frac{\partial \ln \mathcal{L}(\lambda, k|X)}{\partial \lambda} = -\frac{nk}{\lambda} + \frac{k}{\lambda^{k+1}} \sum_{i=1}^{n} X_i^k = 0.$$

Therefore, maximum-likelihood estimation for λ is

$$\hat{\lambda} = \left(\sum_{i=1}^{n} X_i^k\right)^{\frac{1}{k}}.$$

Bayesian inference. Assume k is known. Instead of estimating λ we give an estimation for λ^k . Let's say that prior distribution of λ^k is Inv- $\Gamma(\alpha, \beta)$:

$$h(\lambda^k) = \frac{\beta^{\alpha}}{\Gamma(\alpha)} \lambda^{-k(\alpha+1)} e^{-\beta/\lambda^k}.$$

Posterior distribution then:

$$f(\lambda^k|X) \propto \lambda^{-k(\alpha+1+n)} e^{-\frac{1}{\lambda^k}(\beta + \sum_{i=1}^n X_i^k)} \sim \text{Inv-}\Gamma(\alpha + n, \beta + \sum_{i=1}^n X_i^k).$$

Bayesian estimator:

$$\mathbb{E}[\lambda^k|X] = \frac{\beta + \sum_{i=1}^n X_i^k}{\alpha + n - 1},$$

MAP estimator:

$$\lambda_{MAP}^k = \frac{\beta + \sum_{i=1}^n X_i^k}{\alpha + n + 1}.$$

Part III

Discrete univariate distributions

14 Beta-binomial distribution

15 Binomial distribution

Notation	$X \sim \operatorname{Bin}(n, p)$
Parameters	$n \in \mathbb{N}, p \in [0, 1]$
Support	$k \in \{0, \dots, n\}$
P.m.f.	$\mathbb{P}(X=k) = \binom{n}{k} p^k (1-p)^{n-k}$
C.d.f.	$\mathbb{P}(X \le k) = I_{1-p}(n-k, 1+k)$
Expectation	$\mathbb{E}[X] = np$
Variance	Var(X) = np(1-p)
Median	[np]
Mode	[(n+1)p]
C.f.	$\phi(t) = (1 - p + pe^{it})^n$

15.1 Bernoulli

Notation:

 $X \sim \text{Bernoulli}(p)$.

Relation to Binomial distribution:

 $X \sim \text{Bin}(1, p)$.

16 Poisson distribution

Notation	$X \sim \text{Po}(\lambda)$
Parameters	$\lambda > 0$
Support	$k \in \mathbb{N}_0$
P.m.f.	$\mathbb{P}(X=k) = \frac{\lambda^k e^{-\lambda}}{k!}$
C.d.f.	$\mathbb{P}(X \le k) = Q(k+1, \lambda)$
Expectation	$\mathbb{E}[X] = \lambda$
Variance	$Var(X) = \lambda$
Median	$\sim \max\left(\left[\lambda + \frac{1}{3} - \frac{0.02}{\lambda}\right], 0\right)$
Mode	$[\lambda]$
C.f.	$\phi(t) = \exp\{\lambda(e^{it} - 1)\}$

Generator (let $\delta = \mu \in \mathbb{Z}$). (There is a mistake in Lemma 3.8 in first inequality). Recall that

$$q(X) = X \ln(\lambda) - \ln\left(\frac{(\mu + X)!}{\mu!}\right).$$

We denote acceptance probability $\mathbb{P}(W \leq q(X))$ by p.

• $k = \mu$. Probability to be in this setting is 1/c.

$$\mathbb{P}(X=0|W\leq q(X)) = \frac{\mathbb{P}(X=0,W\leq q(X))}{\mathbb{P}(W\leq q(X))} = \frac{1}{pc}.$$

On the other hand it should be equal to:

$$\frac{1}{pc} = \frac{\lambda^{\mu} e^{-\lambda}}{\mu!}.$$

• $k = \mu + 1$.

$$\begin{split} \mathbb{P}(X=1|W\leq q(X)) &= \frac{\mathbb{P}(X=1,W\leq q(X))}{\mathbb{P}(W\leq q(X))} = \frac{\lambda}{p(\mu+1)c} \\ &= \frac{\lambda^{\mu+1}e^{-\lambda}}{(\mu+1)!}. \end{split}$$

• $k < \mu$. Here was mistake in the book. We adjust the probabilities. Probability to be in this setting is $\sqrt{\pi\mu/2e}/c$.

$$\mathbb{P}(W \leq q(X), X = k - \mu | U \leq c_1) = \mathbb{P}\left(-\frac{N^2}{2} + \frac{1}{2} - E < q(\lfloor -|N|\sqrt{\mu}\rfloor), \lceil |N|\sqrt{\mu}\rceil = \mu - k\right)$$

$$= \mathbb{P}\left(-\frac{N^2}{2} + \frac{1}{2} - E < \lfloor -|N|\sqrt{\mu}\rfloor \ln(\lambda) - \ln\left(\frac{(\mu + \lfloor -|N|\sqrt{\mu}\rfloor)!}{\mu!}\right), \frac{\mu - k - 1}{\sqrt{\mu}} \leq |N| < \frac{\mu - k}{\sqrt{\mu}}\right)$$

$$= \mathbb{P}\left(U < \exp\left\{\frac{N^2}{2} - \frac{1}{2} + \lfloor -|N|\sqrt{\mu}\rfloor \ln(\lambda) - \ln\left(\frac{(\mu + \lfloor -|N|\sqrt{\mu}\rfloor)!}{\mu!}\right)\right\}$$

$$= \frac{\mu - k - 1}{\sqrt{\mu}} \leq |N| < \frac{\mu - k}{\sqrt{\mu}}\right)$$

$$= \sqrt{\frac{2}{e\pi}} \int_{\frac{\mu - k - 1}{\sqrt{\mu}}}^{\frac{\mu - k}{\sqrt{\mu}}} \exp\left\{\lfloor -|n|\sqrt{\mu}\rfloor \ln(\lambda) - \ln\left(\frac{(\mu + \lfloor -|n|\sqrt{\mu}\rfloor)!}{\mu!}\right)\right\} dn$$

$$= \sqrt{\frac{2}{e\pi\mu}} \int_{\mu - k - 1}^{\mu - k} \exp\left\{\lfloor -z\rfloor \ln(\lambda) - \ln\left(\frac{(\mu + \lfloor -z\rfloor)!}{\mu!}\right)\right\} dz$$

$$= \sqrt{\frac{2}{e\pi\mu}} \exp\left\{(k - \mu) \ln(\lambda) - \ln\left(\frac{k!}{\mu!}\right)\right\}$$

$$= \sqrt{\frac{2}{e\pi\mu}} \lambda^{k - \mu} \frac{\mu!}{k!}$$

Hence,

$$\begin{split} \mathbb{P}(X = k - \mu | W \leq q(X)) &= \frac{\mathbb{P}(W \leq q(X), X = k - \mu)}{\mathbb{P}(W \leq q(X))} \\ &= \sqrt{\frac{2}{\pi \mu e}} \lambda^{k - \mu} \frac{\mu!}{k!} \cdot \sqrt{\pi \mu e/2} \frac{\lambda^{\mu} e^{-\lambda}}{\mu!} \\ &= \frac{\lambda^k e^{-\lambda}}{k!} \end{split}$$

• $k \in [\mu + 2, 2\mu]$. Probability to be in this setting is $\sqrt{\frac{3\pi\mu}{4}}e^{\frac{1}{3\mu}}/c$. We also have

$$W = \frac{-Y^2 + 2Y}{3\mu} - E = \frac{1}{3\mu} - \frac{N^2}{2} - E.$$

Then

$$\begin{split} \mathbb{P}(W \leq q(X)|X = k - \mu|U \in \ldots) &= \mathbb{P}\bigg(\frac{1}{3\mu} - \frac{N^2}{2} - E < q(\lceil 1 + |N|\sqrt{3\mu/2} \rceil), \lceil 1 + |N|\sqrt{3\mu/2} \rceil) = k - \mu \\ &= \mathbb{P}\bigg(U < \exp\Big\{-\frac{1}{3\mu} + \frac{N^2}{2} + q(\lceil 1 + |N|\sqrt{3\mu/2} \rceil)\Big\}, \\ &= \frac{k - \mu - 2}{\sqrt{3\mu/2}} < |N| \leq \frac{k - \mu - 1}{\sqrt{3\mu/2}}\bigg) \\ &= \sqrt{\frac{2}{\pi}} e^{-\frac{1}{3\mu}} \int_{\frac{k - \mu - 1}{\sqrt{3\mu/2}}}^{\frac{k - \mu - 1}{\sqrt{3\mu/2}}} \exp\Big\{q(\lceil 1 + |n|\sqrt{3\mu/2} \rceil)\Big\} dn \\ &= \sqrt{\frac{4}{3\pi\mu}} e^{-\frac{1}{3\mu}} \int_{k - \mu - 1}^{k - \mu} \exp\Big\{\lceil z \rceil \ln(\lambda) - \ln\bigg(\frac{(\mu + \lceil z \rceil)!}{\mu!}\bigg)\Big\} dz \\ &= \sqrt{\frac{4}{3\pi\mu}} e^{-\frac{1}{3\mu}} \mu! \frac{\lambda^{k - \mu}}{k!}. \end{split}$$

• $k > 2\mu$. Probability to be in this setting is $6e^{-\frac{2+\mu}{6}}/c$.

$$\begin{split} \mathbb{P}(W \leq q(X)|X = k - \mu|U \in \ldots) &= \mathbb{P}\bigg(-\frac{2 + \mu}{6} - V - E < q(\lceil \mu + 6V \rceil), \lceil \mu + 6V \rceil = k - \mu\bigg) \\ &= \mathbb{P}\bigg(-\frac{2 + \mu}{6} - V + \ln(U) < \lceil \mu + 6V \rceil \ln(\lambda) - \ln\bigg(\frac{(\mu + \lceil \lambda + 6V \rceil)!}{\mu!}\bigg) \\ &= \mathbb{P}\bigg(U < \exp\bigg\{\frac{2 + \mu}{6} + V + \lceil \mu + 6V \rceil \ln(\lambda) - \ln\bigg(\frac{(\mu + \lceil \mu + 6V \rceil)!}{\mu!}\bigg)\bigg\} \\ &= \frac{k - 2\mu - 1}{6} < V \leq \frac{k - 2\mu}{6}\bigg) \\ &= \int_{\substack{k - 2\mu - 1 \\ 6}}^{\frac{k - 2\mu}{6}} \exp\bigg\{\frac{2 + \mu}{6} + \lceil \mu + 6v \rceil \ln(\lambda) - \ln\bigg(\frac{(\mu + \lceil \mu + 6v \rceil)!}{\mu!}\bigg)\bigg\} dv \\ &= \frac{e^{\frac{2 + \lambda}{6}}}{6} \int_{k - \mu - 1}^{k - \mu} \exp\bigg\{\lceil z \rceil \ln(\lambda) - \ln\bigg(\frac{(\mu + \lceil z \rceil)!}{\mu!}\bigg)\bigg\} dz \\ &= \frac{e^{\frac{2 + \lambda}{6}}}{6} \exp\bigg\{(k - \mu) \ln(\lambda) - \ln\bigg(\frac{k!}{\mu!}\bigg)\bigg\} \\ &= \frac{e^{\frac{2 + \lambda}{6}}}{6} \lambda^{k - \mu} \frac{\mu!}{k!} \end{split}$$

$$\mathbb{P}(X = k - \mu | W \le q(X)) = \frac{\mathbb{P}(W \le q(X), X = k - \mu)}{\mathbb{P}(W \le q(X))}$$
$$= \frac{e^{\frac{2+\lambda}{6}}}{6} \lambda^{k-\mu} \frac{\mu!}{k!} \cdot \frac{6e^{-\frac{2+\mu}{6}}}{pc}$$
$$= \frac{\lambda^k e^{-\lambda}}{k!}$$

Part IV Bivariate distributions

- 17 Bivariate Normal distribution
- 18 Normal-Inverse-Gamma distribution
- 19 Trinomial distribution

Part V Circular distributions

- 20 von Mises distribution
- 21 Wrapped Exponential distribution

Part VI

Singular distributions

22 Cantor distribution

Implemented distributions (under titles special cases are listed):

- Continuous distributions
 - Generalised extreme value ????????

Gumbel

Frechet

Weibull

- Geometric-Stable distribution

(Asymmetric) Laplace distribution

- Inverse-Gamma
- Inverse-Gaussian
- Irwin-Hall
- Kolmogorov-Smirnov

Logistic Log-Normal Nakagami Chi Maxwell-Boltzmann Rayleigh Noncentral Chi-Squared Pareto Planck Raised-cosine Raab-Green Sech Stable Cauchy Holtsmark Landau Levy Normal t-distribution Triangular Von-Mises Wigner-Semicircle Disrete: Beta-binomial Binomial Bernoulli Categorical Hypergeometric Logarithmic Negative-binomial (Polya) Pascal Geometric Negative-hypergeometric Poisson Rademacher Skellam Uniform discrete Yule Zeta Zipf Singular: Cantor Bivariate: Bivariate Normal Normal-inverse-Gamma
